Validation

GRESB Validation

Automatic	Automatic validation is integrated into the portal as participants fill out their Assessments, and consists of errors and warnings displayed in the portal to ensure that Assessment submissions are complete and accurate.	
Manual	Manual validation takes place after submission, and consists of document and text review to check that the answers provided in Assessment are supported by sufficient evidence. The manual validation process reviews the content of all Assessment submissions for accuracy and consistency.	
Boundaries	The evidence provided in Performance R1.1 Reporting Characteristics is reviewed for a subset of participants to confirm that all direct real estate assets held by the reporting entity during the reporting year are included in the reporting boundaries.	Not Selected

Asset-level Data Validation

Logic Checks	There is a comprehensive set of validation rules implemented for asset-level reporting. These rules consist of logical checks on the relationships between different data fields in the Asset Portal. These errors appear in red around the relevant fields in the Asset Portal Data Editor, along with a message explaining the error. Participants cannot aggregate their asset data to the portfolio level, and therefore cannot submit their Performance Component, until all validation errors are resolved.
Outlier Detection	Based on statistical modelling, GRESB identifies outliers in reported performance data for selected indicators in the Real Estate Performance Component. This analysis is performed to ensure that all participating entities included in the benchmarking and scoring process are compared based on a fair, quality-controlled dataset.

Reporting Boundaries

Additional context on reporting boundaries

 The evidence is the 2023 Real Estate Reporting Scope Evidence Template and supports the number of assets, floor area and the percentage of that GAV fund of each property type. The statement is signed by entity representative and confirms that the portfolio composition reported is truthful, accurate and complete and it represents the entire portfolio during the reporting year.

Leadership

ESG Commitments and Objectives

This aspect evaluates how the entity integrates ESG into its overall business strategy. The purpose of this section is to (1) identify public ESG commitments made by the entity, (2) identify who is responsible for managing ESG issues and has decision-making authority, (3) communicate to investors how the entity structures management of ESG issues, and (4) determine how ESG is embedded into the entity.

Communicate the objectives and explain how they are integrated into the overall business strategy (maximum 250 words)

 RBR Asset is the manager of the entity RBR Properties. The company's ESG objectives are stated in the ESG Policy which is publicly available on the company's website. The document presents the objectives in: GENERAL SUSTAINABILITY: Invest in a better way GOVERNANCE: Our goal is to have an exemplary partnership not only because of its financial value, but we believe that it contributes to the training of new leaders and offers growth opportunities for its partners and associates, in addition to guiding the relationship with any third parties in a spirit of partnership and respect. SOCIAL: RBR understands that it has a duty to impact positively in the society. RBR is concerned about the practices adopted by its partners and service providers. RBR actively contributes to the promotion of general social welfare. RBR works continuously to combat any type of discrimination, disrespect or harassment among its employees, partners, or suppliers. ENVIRONMENTAL: RBR seeks to adopt the best environmental practices in our business and investments, generating long-term value for our investors and society. HEALTH AND WELL-BEING: We understand that the first step towards being a socially responsible company is to take care of the well-being of our employees and suppliers. DEI: RBR has worked to increase the diversity of its staff and taken initiatives that demonstrate, to its employees and to the market, the existence of an open environment free of prejudice, with a focus on the development of all its employees, without any distinction of race, gender or sexual orientation.

Process of informing the most senior decision-maker

 The ESG Task Force meets twice a year to review and define the ESG goals, Climate-related risks and DEI issues for the company. The team meets weekly to report on progress on ESG activities. Whenever possible, decisions are taken unanimously. But, when necessary, the final word belongs to the company's CEO (Ricardo Almendra).

Process for communicating ESG-related incidents

 RBR has an anonymous reporting channel, widely publicized on our website: <https://app.denouncefy.com/portal/rbrasset>. Whenever there is any adversity in relation to ESG conduct, the RBR compliance manager receives the complaint and must immediately notify the COAF (Financial Activities Control Council). If no complaint was made during the year, then, in February, a report must be made to COAF to update the company's situation.

Stakeholder Engagement

Employees

Improving the sustainability performance of a real estate portfolio requires dedicated resources, a commitment from senior management and tools for measurement/management of resource consumption. It also requires the cooperation of other stakeholders, including employees and suppliers. This aspect identifies actions taken to engage with those stakeholders, as well as the nature of the engagement.

Portfolio Improvement Targets (Summary)

Points: 1.11/2

	Type	Long-term target	Baseline year	End year	Externally communicated
 Building certifications	Absolute	80%	2021	2031	No
 Data coverage	Absolute	80%	2021	2025	Yes

Methodology used to establish the targets and anticipated pathways to achieve them:

 Since the decision to participate in the GRESB Real Estate Assessment, the asset managers have been dedicated to collecting information (water consumption, energy and waste generation data) on all the assets. A minimum annual data coverage target of 80% was established, since GRESB allow estimating data for an asset when the missing data does not exceed the minimum between 20% of the total period and 3 months in a single year. This target is been communicated and monitored in the company's annual sustainability report.

In addition, feasibility studies on green building certifications are being carried out in the assets and it is expected that 80% of the portfolio area will be certified.

Portfolio Decarbonization

Values displayed in this Aspect account for the percentage of ownership at the asset level.

Disclaimer

This section presents an analysis of the portfolio's current reported GHG and energy performance against the pathways developed by the Carbon Risk Real Estate Monitor (CRREM). The CRREM pathways were initially developed as a European project to understand the performance of the real estate sector as the energy sector transitions away from carbon-emitting sources. The pathways have since been expanded to include both decarbonization (i.e., GHG emissions and energy pathways) for other countries and use types as well. CRREM is now a global initiative with alignment/cooperation of INREV, EPRA, ULI greenprint, SBTi, IIGCC, NZAOA and many others.

The information in this report is indicative. It is important to understand the methodological underpinnings of the CRREM pathways, the data used in the calculations of portfolios and assets, as well as how to interpret various resulting outputs before using this analysis. These insights are intended to drive conversation and analysis, not to be used as the basis of investment advice or for use in filings with the U.S. Securities and Exchange Commission or other regulators. The CRREM global downscaling pathways are provided without any guarantee of correctness or completeness. Information contained in this report should not be considered a disclosure of low-carbon transition risk facing a real estate portfolio or company.

CRREM pathways have been developed for regions around the globe. The pathways are scenarios illustrating one instance of downscaled sectoral performance targets. The application and interpretation of these scenarios should be informed by important considerations, including conceptual framing, data quality and availability, and analytical assumptions. While some of the pathways are available at the city and sub-national level, most of the pathways are only provided at the national level. This may limit the applicability of the resulting analysis depending on the location of the assets subject to the analysis. Under some circumstances, the CRREM pathways do not currently account for factors including climate zones or local and regional energy supply (e.g., grid regions). It should be noted that work is currently underway to create more granular pathways, that seek to incorporate updated regional data sources and improved assumptions about future growth of the energy sector across the U.S. and Canada.

It is also important to note that the analysis here compares a static (current) intensity value of the real estate portfolio today, against a dynamic pathway that incorporates projections about the decarbonization of the energy grid. Furthermore, the interpretation of any CRREM analysis should be informed by the chosen treatment of renewable energy: On-site renewable energy consumed by the building does not impact the building's energy consumption but does impact its attributable emissions. Off-site renewable energy procurement is not considered in the location-based method used in this analysis. For these reasons and others, the point of intersection should not be considered definitive. Assumptions are likely to compound to increase uncertainty of projections for years further in the future.

The analysis presented in this report is based on the CRREM pathways (released in January 2023). The pathways are meant to be updated periodically and may change based on the state and pace of development in global real estate markets, modifications to the CRREM methodology, updating of datasets underlying the pathways, as well as revisions to the carbon budget based on the most recent science.

GHG Intensities Insights

This section provides an overview of the current GHG intensity performance of this portfolio compared against the relevant [CRREM Decarbonization Pathways](#). It provides a high-level indication of the portfolio's current state of alignment with climate goals or transition risk objectives. The percentage of Floor area above their respective pathways, Assets above their respective pathways, and an indication of the year at which the Portfolio's current GHG intensity intersects its benchmark CRREM decarbonization pathway are calculated for the assets covered by the analysis – i.e. for assets with 100% GHG emissions Data Coverage (area/time) that covers the entire reporting year and having an available corresponding decarbonization pathway.

Note that because the analysis here compares a static (current) intensity value against a dynamic pathway that incorporates factors like projections of grid decarbonization, the point of intersection could be considered as conservative – i.e., resulting in an earlier “intersection year”. For insights into which of your assets are most exposed to climate-related transition risk (regardless of data coverage), the incorporation of projected electricity grid decarbonization, and how these may affect your portfolio over time, please refer to your [Transition Risk Report](#).

The portfolio benchmark decarbonization pathway is a floor area-weighted aggregation of the top-down, property type- and region-specific decarbonization pathways derived by [CRREM](#).

The current portfolio performance is a floor area-weighted aggregation of the current GHG intensities for all assets with 100% GHG emissions Data Coverage (area/time) that covers the entire reporting year and an available corresponding decarbonization pathway. The underlying data consists of the asset-level reported GHG data as part of the 2023 GRESB Real Estate Assessment.

Energy Intensities Insights

This section provides an overview of the current energy intensity performance of this portfolio compared against the relevant [CRREM Energy Pathways](#). It provides a high-level indication of the portfolio's current state of alignment with climate goals or transition risk objectives. The percentage of Floor area above their respective pathways, Assets above their respective pathways, and an indication of the year at which the Portfolio's current energy intensity intersects its benchmark CRREM energy pathway are calculated for the assets covered by the analysis – i.e. assets with 100% energy consumption Data Coverage (area/time) that covers the entire reporting year and having an available corresponding energy pathway.

The portfolio benchmark energy pathway is a floor area-weighted aggregation of the top-down, property type- and region-specific energy pathways derived by [CRREM](#).

The current portfolio performance is a floor area-weighted aggregation of the current energy intensities for all assets with 100% energy consumption Data Coverage (area/time) that covers the entire reporting year and an available corresponding energy pathway. The underlying data consists of the asset-level reported energy consumption data as part of the 2023 GRESB Real Estate Assessment.

Reported Consumption and Emissions

Values displayed in this Aspect account for the percentage of ownership at the asset level.

Energy Consumption

Total: 7,471 MWh

GHG Emissions

Total: 327 tCO₂

Water Consumption

Total: 32,970 m³

Waste Management

Total: 958 t

Note that the Consumption and Emissions contributions breakdown per Property Sector displayed above is solely based on the reported values by the entities. In the case of an incomplete Data Coverage for any Property Sector, the visuals may not provide a fully complete and accurate view on each contribution.

Building Certifications

Values displayed in this Aspect account for the percentage of ownership at the asset level.

Building certifications at the time of design/construction

	Portfolio			
	Certified Area	Certified GAV**	Total Certified Assets	Total Assets
LEED				
Building Design and Construction (BD+C) Certified	24.1%	N/A	1	
Sub-total	24.1%	N/A	1	N/A
Total	24.1%*	N/A	1	6

*In case of assets certified more than once, this number is capped at 100%.
 **Given that this field is optional, it may not be provided for all reporting entities.

Operational building certifications

Energy Ratings

	Portfolio			
	Rated Area	Rated GAV*	Total Rated Assets	Total Assets
Arc Energy Performance Score	69.93%	N/A	4	N/A
Total	69.93%	N/A	4	6

*Given that this field is optional, it may not be provided for all reporting entities.

Risk Assessment

This aspect identifies the physical and transition risks that could adversely impact the value or longevity of the real estate assets owned by the entity. Moreover, it tracks the efficiency measures implemented by the entity over a period of three years.

Values displayed in this Aspect account for the percentage of ownership at the asset level.

Program description and methods used to improve tenant satisfaction

Constant communication on the ESG topic is an important tool for tenant involvement and engagement. In 2022, we developed and distributed an ESG Guide for RBR Asset Tenants which contains everything from basic information on ESG to a list of practical actions that can be taken by each tenant. In addition, throughout the year we distribute informative emails about the conscious use of energy and water, waste recycling, etc.

Program description

 From the desire to contribute and return to society, contributing to the fight and overcoming of important structural deficiencies in our country. RBR has made regular financial donations to serious entities, mostly focused on education. Since December/2019, RBR Asset has committed to donating part of its net profit to non-profit organizations. The donation rate started at 1% and in 2022 this rate increased to 2%. the target is for it to reach 3% by 2025.

Energy Intensities

Entity: 33.4 kWh/m²
 Benchmark: 105.5 kWh/m²

ESG transparency is the foundation for improving the operational performance of assets in real estate portfolios and making progress towards sustainable real assets.

Thanks to an industry-wide commitment to reporting Energy data at the asset level, we are able to provide clearer and more granular ESG data and insights as well as conduct asset-level validation with automated error and outlier checks. The algorithms are iterative, they will be developed based on feedback provided on an on-going basis. The results provide access to consolidated ESG performance at the portfolio level that is underscored by improved data quality at the asset level.

Energy intensities are a fundamental metric of the environmental performance of an asset. These metrics can be used for measuring asset performance over time and for comparison against local/national targets and global goals.

Calculation methodology

The average Energy intensity for the Entity is calculated for all assets from this Property Sub-Type where the Data Coverage (in terms of floor area and time) is 100% and data for the entire year has been reported. Intensity calculations are weighted by floor area.

- If Data Coverage (Area/Time) = 100% and Energy consumption data for the entire year has been reported, the asset is included in the calculation.
- If Data Coverage (Area/Time) < 100%, and/or the data reported does not cover the full reporting year, the asset is excluded from the calculation to minimize any potential skew relating to underlying data bias (e.g. consumption heterogeneity or seasonal effects).

GRESB uses the eligible assets' GFA as a denominator for determining intensities*, and displays calculated values in either kWh/m2 or kWh/sq.ft. depending on the unit selected by the participant.

Assets with identified outliers substantially higher than the upper thresholds as defined in the [GRESB Data Validation Process](#) are excluded from the calculations.

*All GRESB participants are required to use the GFA to report the size of their assets. Participants with information on the Lettable Floor Area (LFA) only were allowed to estimate the size of their common areas (difference between GFA and LFA) using ratio ranges pre-determined by GRESB.

- (d) source and characteristics of GHG emissions offsets

(a) the GHG emissions calculation standard/methodology/protocol: GHG Protocol (b) used emission factors 2021 Emission Factor (BRAZIL) for Utility company = 0,12640 2022 Emission Factor (BRAZIL) for Utility company = 0,04259 (c) level of uncertainty in data accuracy • Brazil: We do not identify uncertainties d) source and characteristics of GHG emissions offsets • Brazil Ministry of Science, Technology and Innovation: <https://www.gov.br/mcti/pt-br/acompanhe-o-mcti/sirene/dados-e-ferramentas/fatores-de-emissao> The GHG emissions has decreased considerable in Brazilian asset due to the decrease in Brazilian's GE emission factor. The emission factor decreased in Brazil (comparing 2021x2022), because in 2021 we had a hydro drought, which caused Brazil to use more thermoelectric plants, consequently increasing the energy emission factor. In 2022 we didn't have extreme droughts and the national energy system used more hydroelectric plants (renewable source, which emits less GHG).

GHG Intensities

Entity: 1.4 kgCO₂/m²
Benchmark: 22.3 kgCO₂/m²

ESG transparency is the foundation for improving the operational performance of assets in real estate portfolios and making progress towards sustainable real assets.

Thanks to an industry-wide commitment to reporting GHG data at the asset level, we are able to provide clearer and more granular ESG data and insights as well as conduct asset-level validation with automated error and outlier checks. The algorithms are iterative, they will be developed based on feedback provided on an on-going basis. The results provide access to consolidated ESG performance at the portfolio level that is underscored by improved data quality at the asset level.

GHG intensities are a fundamental metric of the environmental performance of an asset. These metrics can be used for measuring asset performance over time and for comparison against local/national targets and global goals.

Calculation methodology

The average GHG intensity for the Entity is calculated for all assets from this Property Sub-Type where the Data Coverage (in terms of floor area and time) is 100% and data for the entire year has been reported. Intensity calculations are weighted by floor area.

- If Data Coverage (Area/Time) = 100% and GHG emissions data for the entire year has been reported, the asset is included in the calculation.
- If Data Coverage (Area/Time) < 100%, and/or the data reported does not cover the full reporting year, the asset is excluded from the calculation to minimize any potential skew relating to underlying data bias (e.g. consumption heterogeneity or seasonal effects).

GRESB uses the eligible assets' GFA as a denominator for determining intensities*, and displays calculated values in either tCO₂/m² or tCO₂/sq.ft. depending on the unit selected by the participant.

Assets with identified outliers substantially higher than the upper thresholds as defined in the [GRESB Data Validation Process](#) are excluded from the calculations.

*All GRESB participants are required to use the GFA to report the size of their assets. Participants with information on the Lettable Floor Area (LFA) only were allowed to estimate the size of their common areas (difference between GFA and LFA) using ratio ranges pre-determined by GRESB.

ESG transparency is the foundation for improving the operational performance of assets in real estate portfolios and making progress towards sustainable real assets.

Thanks to an industry-wide commitment to reporting Water data at the asset level, we are able to provide clearer and more granular ESG data and insights as well as conduct asset-level validation with automated error and outlier checks. The algorithms are iterative, they will be developed based on feedback provided on an on-going basis. The results provide access to consolidated ESG performance at the portfolio level that is underscored by improved data quality at the asset level.

Water intensities are a fundamental metric of the environmental performance of an asset. These metrics can be used for measuring asset performance over time and for comparison against local/national targets and global goals.

Calculation methodology

The average Water intensity for the Entity is calculated for all assets from this Property Sub-Type where the Data Coverage (in terms of floor area and time) is 100% and data for the entire year has been reported. Intensity calculations are weighted by floor area.

- If Data Coverage (Area/Time) = 100% and Water consumption data for the entire year has been reported, the asset is included in the calculation.
- If Data Coverage (Area/Time) < 100%, and/or the data reported does not cover the full reporting year, the asset is excluded from the calculation to minimize any potential skew relating to underlying data bias (e.g. consumption heterogeneity or seasonal effects).

GRESB uses the eligible assets' GFA as a denominator for determining intensities*, and displays calculated values in either m³/m² or m³/sq.ft. depending on the unit selected by the participant.

Assets with identified outliers substantially higher than the upper thresholds as defined in the [GRESB Data Validation Process](#) are excluded from the calculations.

*All GRESB participants are required to use the GFA to report the size of their assets. Participants with information on the Lettable Floor Area (LFA) only were allowed to estimate the size of their common areas (difference between GFA and LFA) using ratio ranges pre-determined by GRESB.

Data Monitoring & Review

Review, verification and assurance of ESG data

Submitting ESG data for third-party review improves data quality and provides investors with confidence regarding the integrity and reliability of the reported information. This aspect recognizes the existence and level of third party review of energy, GHG emissions, water, and waste data.

ESG Requirements

Integrating ESG requirements into construction activities can help mitigate the negative impact on ecological systems, and at the same time improve the environmental efficiency of buildings in the operational phase. This aspect assesses the entity's efforts to address ESG-issues during the design, construction, and site development of new buildings.

Business strategy integration

66 RBR decided that all projects must be obligatorily subject to external and independent green building certification. As an example, within the scope of certification, we deal with aspects such as energy efficiency and water consumption, effluent treatment, solid waste management in the construction and operation phases, promotion of the health and well-being of employees and future users, as well as such as the selection of building materials with sustainability criteria.

Materials

Consideration of the environmental attributes of materials during the design of development projects can reduce the overall life cycle emissions. In addition, consideration of health attributes for materials affects the on-site health and safety of personnel and health and well-being of occupants once the development is completed. This aspect assesses criteria on material selection related to (1) environmental and health attributes and (2) life cycle emissions, as well as disclosure on embodied carbon emissions.

Program description

 From the desire to contribute and return to society, contributing to the fight and overcoming of important structural deficiencies in our country. RBR has made regular financial donations to serious entities, mostly focused on education. Since December/2019, RBR Asset has committed to donating part of its net profit to non-profit organizations. The donation rate started at 1% and in 2022 this rate increased to 2%. the target is for it to reach 3% by 2025.

Identification of stakeholders and impacted groups 30% 

Management practices to ensure accountability for performance goals and issues identified during community monitoring 30% 

Other 20% 

Results achieved by entities with donations made by RBR

[NOT ACCEPTED]

Process description

 We periodically monitor the institutions supported by RBR to ensure that donated resources are being used responsibly. Annually we request a report for each entity with the tangible results achieved by each institution. As an example, Instituto SOL, which helps low-income youth with scholarships at private schools, managed to simultaneously support 60 young people in 2022.
